"REASONS AND FACTORS OF VIRTUALITY IN THE LIFE OF YOUNG PEOPLE"

Pulatov Bakhodir Abduraupovich
Teacher at Military education of Fergama state university

Annotation: Internet system is developing in our country and users are using it the line is fast is expanding rapidly . In the last ten years, the number of users of the global network has increased tenfold . The present day https://doi.org/ It is very difficult to imagine our life without the Internet. The Internet has greatly facilitated the communication and exchange of information between people living in different parts of the world.

Key words: Virtualization, globalization, national spirituality, integration, moral threat, worldview Internet, virtual reality, digital technology, transformation.

In the system of the world information society, the effective use of the possibilities of modern virtual technologies is becoming more and more important. It is known that the current era is characterized by the deepening of globalization processes and the fact that they have a noticeable impact on all aspects of our lives. Especially today, prestigious universities of developed countries and scientific research Special attention is being paid to the scientific and practical study of the new virtual culture and its specific features, which is being formed in the centers of society, and the consequences of its existence in virtual reality. Research scientists, political scientists and well-known statesmen who are conducting research on its role and importance have expressed various opinions, views, and opinions. Today, the widespread introduction of information and communication technologies in world practice is characterized by the virtualization of human activity. Because, as M. Castells, considered one of the founders of the information society, rightly stated, "The basis of the modern world is the ``networked" structures " [1]. In fact, in today's society , a wide range of conditions are being created for the formation of various social institutions, structures and associations through the virtual network. In particular, in the virtual world, the influence of ideological-ideological currents, which have supernatural power, is observed to attract young people whose worldview is not yet fully formed, as well as people who do not have a firm opinion. it shows how important it is to study the problem. For this reason, in order to prevent or eliminate virtual threats, ``We should widely attract investments in our country not only in economic sectors, but also in the field of scientific developments" and ``know-how" [2] . Globalization - (globe - globe) means the process of global economic, political and cultural integration and unification. Globalization is an objective and systematic process that covers all spheres of society's life. As a result of the globalization of the economy, economic booms and crises are becoming global in nature . Modern information systems have made it possible for financial capital to move very quickly, and financial markets to operate without interruption. The process of globalization in the cultural sphere is also leading to conflicting results. On the one hand, the Internet, international tourism, movies, books and other products of creative work play a major role in the process of cultural globalization. On the other hand, the popularization of international cultural events, which are often not of high quality, began to threaten the development of national cultures. For example, the process that is now called "mass culture" is one of the events with such negative situations.

Globalization is a complex process that cannot be evaluated uniformly. In this process, every nation strives to take its place and preserve its identity. The process of westernization of traditional civilizations in Asia and Africa is very complicated. In terms of knowledge, each society has its advantages. Therefore , it is necessary to try to ensure the interdependence of the knowledge that already exists in different societies. The concept of "information society" is based on technological progress. The concept of "knowledge society" includes wider social,

www.wordlyknowledge.uz Volume: 2, Issue: 1, 2023

moral and political aspects. In the book "Emergence of Post-Industrial Society" Daniel Bell is the first to say that with the development of human society, social resources have undergone a strategic change. In the industrial society, the strategic resources were capital and labor , but in the future society, the most important strategic resources will be information and knowledge. He writes about this: "Broadly speaking, if the industrial society is based on machine-building technology, the post-industrial society is formed on the basis of knowledge and technology. If capital and labor are the main structural features of the industrial society , then information and knowledge represent the main structural features of the post-industrial society. For this reason, MN Normamatova said, "Each epistemological layer plays the role of an attractor in virtualistic knowledge, attracts conceptual and experimental descriptions of research, and complex knowledge structures are formed." The noted characteristics of virtualistic knowledge indicate the formation of a post-noclassical epistemological structure in it [3]. We are supporting the media that organizes the global media environment based on modern high and digital technologies, which is reflected in every aspect of our life . As a result, the widespread use of digital economy and management methods based on it in practice has become one of the main factors in the development of the world economy. The share of the digital economy in the gross domestic product of developed countries was 1.2 % in 2010 , and by 2018, this indicator was 5.5% [4]. Today, futurologist E. Toffler, at the end of the 20th century , none of us can oppose the idea that the image of a new society " is not based on wealth or violence, but on the intellect and knowledge that creates information " [5]. So, the unique aspect of our time is the domination of information, the domination of the media.

Virtual reality is reality. The concept of "virtual" media is often used in the sense of "invented" and "doesn't exist in reality". However, in the scientific discourse, "virtuality" has begun to be accepted as a type of reality. According to BVMarkov, telecommunication technologies enable democratization at the transnational level [6]. However, the impact of computer technologies and the Internet on modern culture and social-cultural activities cannot be denied. The lexicon on the network is becoming embedded in our daily culture , Internet portals are setting new requirements for our fashion and lifestyle, our appearance and consumer culture. Virtualization does not replace real reality, but they exist in parallel. As DOUsanova noted, "it is different from our physical activity, which always has the goal of obtaining a finished product, which means that it does not emphasize everyday and pragmatic importance, but rather spends a lot of energy on creativity, and in this regard, virtual culture as a high-level culture. is a phenomenon that allows us to characterize" [7-8].

The term "virtual reality" is widespread, especially in the 21st century , and is a rather vague concept. For example, for DVPivavorov, this is "artificial realization (creation) of this or that unrealized or naturally unrealized intellectual probability (abstract or concrete) in a symbol-graphic form " [9]. According to SLKatrechko, this concept has several meanings. can be used, the main of which is the virtual world" characterized by variability and instability" and "an artificial world that is exactly similar to the physical world created by man". From this point of view , "any artificial (cultural) world that can exist in real time for a certain (limited) time can be called virtual" [10], such as the world of books, films, theater performances. we can give an example of this.

American researcher F. Hammit, researching the sources of virtualization , in his opinion, there are several reasons for the "Virtualization" phenomenon, which are based on the improvement of the synthetic functions of the film. According to him , "computer functions can be completely changed as a result of software improvements" [11]. Working in the field of virtual reality is easy and preferred due to its speed, moreover, it has a game character [12].

According to statistics, young people between the ages of 21 and 30 are the most active Internet users in the world. In 2007, the number of Internet users in our country was one million ,

www.wordlyknowledge.uz Volume: 2, Issue: 1, 2023

and at the end of 2016, this figure exceeded twelve million. The era we live in is called the "Internet age". According to the United Nations , 4.1 billion people use the Internet . In Uzbekistan, this figure is approximately 12.2 million . The Internet has many advantages . Unfortunately, in the hands of malicious people, the Internet is becoming a tool for spreading mischief, ignorance, and immorality.

Most of the users are young people. That is why the threats on the Internet are aimed at children and teenagers. According to statistics, 42% of teenagers on earth are users of web pages promoting threats such as immorality, 38% violence, and 26% nationalism and separatism.

Conclusion: "He who has information owns the world" is recognized by everyone today. Today, it is necessary to use the global network wisely. For this, it is necessary to observe the culture of receiving and transmitting information, using the Internet. That's the only way you won't fall into the "Spider's Web" of the global network . Don't waste your time, because every thread is the answer to what happened. (folk wisdom). Based on the above opinion, the following socio-philosophical aspects of virtual technologies addressed by modern researchers can be indicated: transformation of social institutions in the conditions of information society development; development of online associations and their cooperation with traditional associations; the development and influence of the Internet on the change of the social communication system; transformation of modern education, development of distance education; the problem of preserving cultural identity; the formation of "electronic economy", "electronic government" and others. Today, the weapons available in the hands of mankind are enough to destroy the earth several times. But the biggest danger in the present time is the continuous ideological struggle to capture people's minds and hearts. A smart and intelligent person is the one who has a wide range of thoughts, who can see the distance as if it were near , far from the sleep of heedlessness, but always awake with his thoughts and thoughts, who can draw conclusions even from subtle hints." (Mahmud Zamakhshari).)
