INDUSTRIAL PRODUCTION IN THE ECONOMIC DEVELOPMENT OF THE REGION IMPORTANCE OF SUPPORT

Khazratov Sarvar Ibrahimovich

Introduction

Subject of regional economic science country production the location of their forces, socio-economic development of the territories, important natural economic, demographic and environmental characteristics and their internal territory, studies interregional and Interstate economic relations. Who say otherwise in our case, the main task of the science of regional economics is social development consists in the study of the territorial aspects of release.

Regional economy as a science of productive forces and social territorial study of infrastructure elements, laws and principles will; taking into account the general development strategy and environmental situation of the country determines the directions of placement of production forces in the case; territories studies its economy and interregional economic relations. In addition,deployment and development of production Forces of the regional economy a holistic study of his issues on a nationwide scale. After all, every territory the economy, first of all, is a structural component of the country's single economic complex is part of.

At the same time, this science is a natural resource of countries and territories capacity, role of the country in the world agricultural system, population, labor resources and studies current demographic problems; in a market economy analyzes the economic level of countries and territories and production determines the main factors of their strength. Region-the country's only national economy the territorial subsystem of the complex is. It is demographic, natural-ecological, internal communication and interaction of socio-economic and technical-economic processes it is a holistic unit formed due to its relationship.

At the same time, this science is a natural resource of countries and territories capacity, role of the country in the world agricultural system, population, labor resources and studies current demographic problems; in a market economy analyzes the economic level of countries and territories and production determines the main factors of their strength. Region-the country's only national economy the territorial subsystem of the complex is. It is demographic, natural-ecological, internal communication and interaction of socio-economic and technical-economic processes it is a holistic unit formed due to its relationship.

Formation of economic knowledge of future economists Economic Sciences the only area in the system that deals with a specific area is regional it should start with the study of Economics. It should be noted that any economic activity occurs in a specific area. In this, The Economist resource perfect the characteristics of the potential, economic system and the level of its development it is necessary to know. Thus, the regional economy – production forces studying the issues of placement and development, social and economic processes in countries and regions in connection with natural and environmental conditions is a science.

Another of the important functions of regional politics at the moment – Economic Cooperation and interregional territorial division of Labor consists of refinement. Of the most important tasks in the development of Regions one-eliminate differences in the standard of living of residents of different regions consists of making. The level of development in the performance of this task was low development and implementation of special state programs for the development of territories increase, territorial production in regions rich in natural resources the organization of its regions is important.
